EXPERIENCE

Welo Data

Austin, TX, USA

Metadata Analyst

Oct 2024 - Present

- Collaborate with global teams and partner integrations to standardize metadata-quality processes and validation requirements across **100+ international markets**, translating partner-specific business rules into onboarding checks.
- Process **3+** partner XML Catalog and Availability feeds per month, using **Python (pandas)** to parse, clean, and standardize reference-level metadata prior to test-environment ingestion.
- Evaluate mapped vs. unmapped assets after AI-automated matching in the test environment, using **Excel-based statistical sampling** and **hypothesis testing** to assess mapping accuracy and identify metadata discrepancies before production ingestion.
- Build **Tableau** dashboards to identify metadata error patterns by partner, locale, content type, and field, then performed **root-cause analysis (RCA)** to trace recurring issues to partner data sources and provided partners with data-quality findings for correction and resubmission, cutting recurring error rates by **60%**.

REL8ED.TO ANALYTICS

Rochester, NY, USA

Data Scientist intern

Jul 2023 - Aug 2023

- Cleaned and standardized **100K+** North American company records using **Python**, scraping NAICS codes and definitions to build a reference dictionary for LLM-based industry classification.
- Integrated **OpenAI** embedding model with the NAICS reference dictionary to classify companies by industry; used **Excel PivotTables** to analyze correct and incorrect tagging rates across key industries and identify categories with higher classification errors.
- Evaluated the LLM-based classification workflow against manual processing, demonstrating **85%** accuracy, reducing turnaround from weeks to minutes, and projecting \$50K in manual processing cost savings.

LEAFPRINT ENTERPRISES

Cedar Hills, UT, USA

Data Analyst intern

Jan 2022 - May 2022

- Contributed to an **ETL** pipeline to ingest **100K+** geographical records collected from World Archive API and Airtable into **AWS RDS**, helping structure location data through a relational schema for downstream analysis and reporting.
- Identified inconsistencies and missing geographic attributes using **SQL**, tracing data-quality issues across Southeast Asia and Southern Europe and improving regional data accuracy by **25%**.
- Built **Excel** Pivot Table **and** dashboard to track mapping coverage and data completeness for future reference.

BENIT PTY LTD

Hanoi, Vietnam

Data Analyst intern

Mar 2021 - Jul 2021

- Analyzed **1M+** learner and course activity records ingested from **Amazon S3 bucket** into **Amazon Redshift**, using **SQL** to join learner, enrollment, and course activity tables and calculate enrollment frequency, course views, activity frequency, and completion rate for learner segmentation and engagement analysis.
- Analyzed learner engagement and subscription behavior using **SQL** and **Python**, segmenting users by activity level and subscription status; found that highly engaged learners had higher course completion and subscription rates, helping Product Managers prioritize learner retention initiatives.
- Supported **10+** A/B tests for product initiatives by defining recommendation CTR, course enrollment rate, and course completion rate as experiment KPIs, validating treatment and control groups, and analyzing performance; evaluated recommendations based on learners' past enrollments, course views, and completion history, **resulting in a 12% relative lift in course completion**.

EDUCATION

UNIVERSITY OF ROCHESTER

M.S in Data Science

AUGUSTANA COLLEGE

B.A in Applied Mathematics

Rochester, NY, USA

Winter 2023

Rock Island, IL, USA

Summer 2022

PROJECTS

Machine learning: [Mental health classification \(Python\)](#) | [Alternative implementation in R with statistical analysis](#)

- Analyzed **employee mental health survey data** to identify workplace factors associated with mental well-being and evaluate whether employee characteristics could **predict prior mental health treatment-seeking**, using exploratory analysis and **machine learning classification** to uncover key drivers and assess predictive performance.

Data Engineering: [NYC bike tracking forecast](#)

- Led a team of 4 in developing an end-to-end **ETL** pipeline, employing **PySpark** to create bronze, silver, and gold data tables; Achieved a 70% accuracy rate in building a forecasting model using Prophet for the Citibike Bike Sharing app on **Databricks**.
